Collection round 2: finding the instruments the first collection missed

- Summary
- Where the candidates came from
- What could and could not be fetched
- Before and after, by region and robot group
- What the blind annotation made of the additions
- Do the collectors' catalogue labels agree with the blind reading of the text?
- Newly captured instruments
- Method notes and limitations

Companion to the analysis report. All counts refer to content-analysed documents unless stated otherwise. The headline counting unit is the principal instrument: a text of instrument class that is not a commencement order, levy or fee instrument, individual exemption, direction, approval or permit, definitions-only part, table of contents, EEA incorporation decision, language-version corrigendum, byte-identical duplicate, catalogue page or metadata stub under 150 words; amendments count. Every count that uses another unit says so. The round-2 collectors, the reviewers of the previous version and the auditors were AI agents (Claude) running in one Claude Code session; no person read or labelled any document.

Summary

The first collection contained 1,656 documents, of which 65 were texts of instrument class in the embodied-AI set and 34 were robot-specific. Round 2 searched official legal databases, government repositories, standards catalogues, treaty-body archives and regulator sites for instruments that the first collection had not captured. After de-duplication against the first collection and within the round, 2,075 candidates remained (1,157 from nine specialised collector agents and 918 from eight scripted harvester runs over official legal databases). Text could be obtained for 1,720 of them (1,704 fetched from the issuing source and 16 standards scope texts; four of these were recovered in a retry pass after the review of the previous version), 1,720 were annotated with the same metadata-blind, extended-excerpt policy as the first collection's governance documents (up to 110,000 characters), and 1,636 entered the master table after 84 duplicates were removed (identical normalised title and jurisdiction, mostly against other round-2 rows).

The blind annotation confirms that most additions are legal texts rather than commentary, and the counting unit then matters. Of the 1,621 usable round-2 documents, 1,345 are texts of instrument class and 985 are principal instruments; 741 of the instrument-class texts are in the embodied-AI set, of which 441 are principal instruments and 371 are principal instruments rated robot-relevant (relevance 2 or 3). The 300 embodied-set texts that are not principal instruments are 217 catalogue or register pages, 35 metadata stubs and 48 ancillary, dependent, incorporation or language-copy acts. Among binding texts, 284 embodied-set texts resolve into 188 principal binding instruments, 160 of them robot-relevant, 134 with autonomy or AI provisions in the text and 10 naming AI explicitly: most binding rules that reach robots in this collection are machine-class rules (aviation, road vehicle, machinery, product safety) with no AI content.

Across the merged collection, on the comparable unit (every text of instrument class), embodied-AI governance instruments rose from 65 to 908 (x14.0), robot-specific instruments from 34 to 785, and binding embodied instruments from 5 to 377. These ratios describe where the two collections searched, not a change in the world: the first collection searched the web for material about embodied AI; the second searched legal databases for the machine-class rules. On the headline unit the merged collection holds 598 principal embodied instruments (490 robot-relevant; 464 with autonomy or AI provisions and 164 naming AI explicitly) and 278 principal binding instruments (241 robot-relevant; 277 when counted once per instrument family; 201 with autonomy or AI provisions and 25 naming AI explicitly; T53b). The coverage audit against the 39 reference instruments moved from 11 captured in the first collection to 29 on the strict criterion (a principal instrument with a content-analysed capture) and from 12 to 36 on the looser title-family match used previously. Still missing under the strict criterion: China Shenzhen Intelligent and Connected Vehicles regulation (2022); ISO/TS 15066:2016 collaborative robots; IEC 61508 functional safety; ISO 26262 road vehicle functional safety; ISO 21448 (SOTIF); ISO/IEC 42001 AI management system; IEEE 7001 transparency of autonomous systems; ANSI/RIA R15.06 industrial robot safety; ANSI/A3 R15.08 industrial mobile robots; Taiwan Industrial Robot Hazard Prevention Standards (1987, amended 2018).

Table 53. Before/after on the comparable unit (every text of instrument class): v2 (original collection) versus v3/v4 (original plus round 2), content-analysed documents only

measure	v2	v3	added	ratio
Documents (annotated)	1656	3450	1794	2.08
Usable documents	1538	3320	1782	2.16
Embodied-AI set	675	1704	1029	2.52
General-AI set	806	1025	219	1.27
Governance documents (incl. reports)	343	1860	1517	5.42
Governance instruments, all	345	1846	1501	5.35
Governance instruments, embodied-AI set	65	908	843	13.97
Robot-specific instruments (relevance 2+)	34	785	751	23.09
Binding instruments, all	34	815	781	23.97
Binding instruments, embodied-AI set	5	377	372	75.4
Binding instruments, robot-specific	4	329	325	82.25
Soft-law instruments, embodied-AI set	50	417	367	8.34
Proposals and drafts, embodied-AI set	10	114	104	11.4
Government reports, embodied-AI set	24	98	74	4.08
Jurisdictions with an embodied instrument	30	66	36	2.2

Where the candidates came from

The table gives, per source, the candidates after de-duplication, the texts obtained, the usable documents and what the blind annotation made of them; “instruments” are principal instruments. The Australian register shows the effect of the counting unit: its candidates are usable and mostly in the embodied-AI set, but they are register pages and individual approvals, directions and exemptions, so almost none is a principal instrument.

Table 50. Round-2 discovery sources: candidates after de-duplication, texts obtained, documents content-analysed, and what the blind annotation made of them

source	kind	candidates	text_obtained	content_analysed	usable	embodied	instruments	embodied_instruments

www.fedlex.admin.ch	4

Candidates without text remain in the inventory (data/round2_inventory.csv) with their metadata but are not part of any content-analysed count. The main losses are catalogue pages behind bot challenges or outside the sandbox network policy (46 candidates on blocked hosts; 272 with HTTP errors or JavaScript-only pages; 37 failed transfers). A retry pass with the improved routes after the review of the previous version recovered four texts; 189 of the 355 candidates still without text were recorded by their collectors as legally binding. They include instruments a collector verified but the environment could not read (the Hangzhou embodied-robot regulations, the Shenzhen intelligent-connected-vehicle, AI-industry and low-altitude-economy regulations, Hong Kong Cap. 374AF, the Korean Intelligent Robots Act and autonomous-vehicle decrees, DoD Directive 3000.09, California SB 243, India's Drone Rules 2021, the EU Product Liability Directive and Toy Safety Regulation, the French automated-vehicle ordinance and decree, ANSI/A3 R15.06-2025 and GB/T 48317.1-2026); the methods document lists them as the first targets of a third round.

Before and after, by region and robot group

These comparisons are on the comparable unit (every text of instrument class) because the first collection carries no counting-unit flags; they measure the change of collection strategy, not a change in the world.

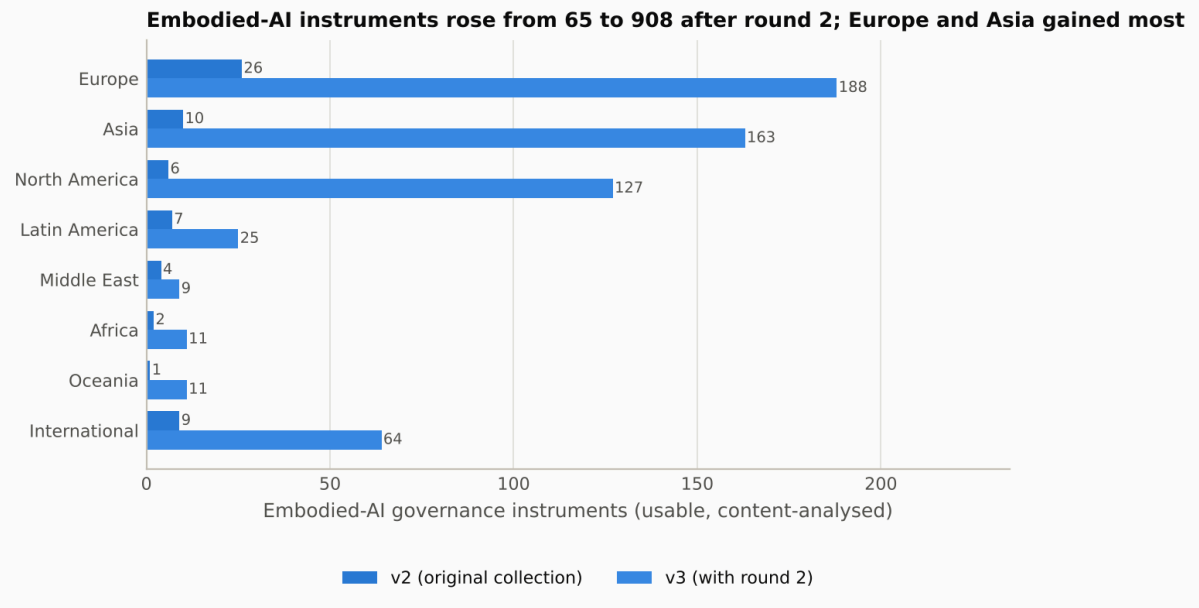

Figure 51. Embodied-AI governance instruments by jurisdiction region, v2 (original collection) versus v3 (with round 2).

Table 54. Embodied-AI instruments and documents by jurisdiction region, v2 versus v3

What the blind annotation made of the additions

The excerpt cleaner used for the previous version deleted most of the text of Chinese, Japanese and Korean documents before the model saw it (a rule for Latin-script navigation menus dropped every line without a digit, capital letter or ASCII sentence punctuation). The cleaner was made character-aware and 437 round-2 and 66 round-1 documents in those languages were re-annotated; of these 503 documents, 61 changed embodied-set membership and the number rated as not about AI fell from 206 to 162. Four rules then correct status and class labels the annotation got wrong at scale (standards in development are drafts, mandatory GB standards are binding, CCW working papers and chair's texts are position documents, proposals whose adopted act is present are superseded), and 157 document-level corrections on 91 documents (156 rows concern round-2 documents) were converted from the governance expert's audit of the previous version; in that audit's released row table, 119 of 165 risk-stratified rows carry an error code and 107 a material one, so these are upper bounds for the tables as a whole. The class counts below are after these corrections.

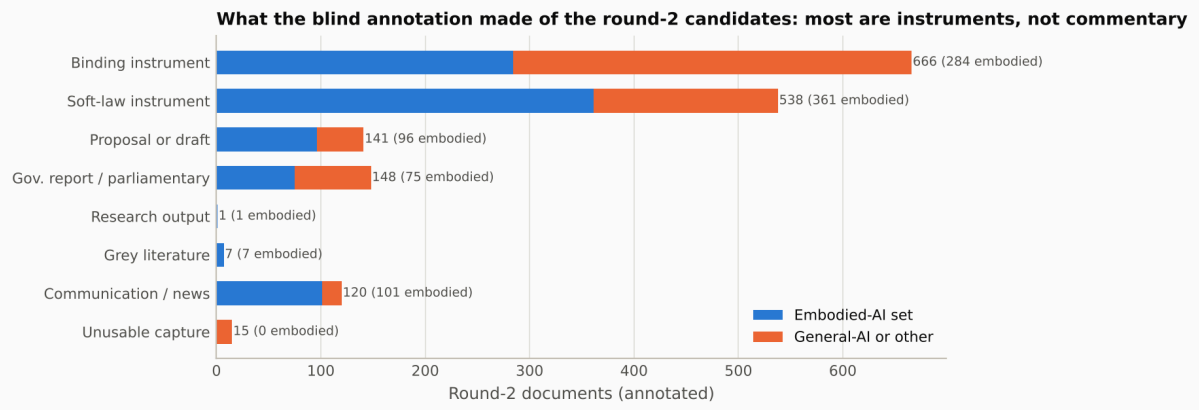

Figure 52. Round-2 additions by annotated document class, split into the embodied-AI set and the rest.

Table 56. Round-2 additions by annotated document class, with the embodied-AI and robot-specific subsets

doc_class	documents	embodied_set	robot_specific
Binding instrument	666	284	160
Soft-law instrument	538	361	156
Proposal or draft	141	96	55
Gov. report / parliamentary	148	75	0
Research output	1	1	0
Grey literature	7	7	0
Communication / news	120	101	0
Unusable capture	15	0	0

Do the collectors' catalogue labels agree with the blind reading of the text?

This is a consistency check, not a validation. The collector agents were AI agents of the same model family as the annotator, the 918 harvested rows carry one constant label per source written into the harvester, and no person recorded any of the reference values. On the usable round-2 documents the annotation agrees with the collector label on whether an instrument is legally binding in 93.0% of cases (kappa 0.86, n = 1,603), on jurisdiction in 98.1% (n = 1,619), on year within one in 93.9% (n = 1,537) and on document class in 76.6% (kappa 0.66, n = 1,603). Split by origin, binding-nature agreement is 91.9% (kappa 0.79, n = 751) for collector-agent rows and 94.0% (kappa 0.88, n = 852) for harvested rows. The reliability evidence for round-2 labels is a stratified sample of 160 round-2 documents re-annotated by a second model and by a same-model re-run: median kappa over single-label and ordinal fields 0.86 and 0.91; the weakest fields against the second model are page quality 0.53; stance toward regulation 0.65; publication stage 0.66; date basis 0.70; instrument status 0.75 (tables S09 and S09b).

Table 57. Agreement between the collectors' metadata (recorded from catalogue pages) and the metadata-blind annotation of the document text, round-2 usable documents

field	n	agreement	kappa
Binding nature (collector legally_binding vs annotated binding instrument)	1603	0.93	0.856
Jurisdiction (collector code vs annotated from text)	1619	0.981	nan
Year (collector vs annotated, within 1 year)	1537	0.939	nan
Document class (collector instrument type mapped to class vs annotated class)	1603	0.766	0.66

Newly captured instruments

T59 lists the 188 principal binding instruments in the embodied-AI set added by round 2 and T60 the 371 principal instruments rated robot-relevant. Their precision is bounded by an independent audit of the previous version's binding embodied list: of 100 randomly sampled documents from that list of 299, 67 were distinct instruments, 97 binding, 56 carried substantive embodied provisions, 67 contained autonomy or AI content and 14 named AI explicitly; 54 met all of distinct, binding and substantive (95% Wilson interval 44 to 63%), which implies about 161 such instruments (132 to 190) in that list rather than 299. The rule-based unit used here (principal instrument, embodied set, relevance 2 or 3) passes 61 of the same 100 documents (51 to 70%) and agrees with the audit on 77 (kappa 0.53; T62). The counts in these tables are therefore upper bounds on precision, and the unread candidates above make them lower bounds on coverage.

Method notes and limitations

- Discovery combined nine collector agents (regional, thematic and standards briefs with explicit exclusion lists of the first collection's holdings) and scripted harvests of EUR-Lex (CELLAR SPARQL, by title and by EuroVoc concept), legislation.gov.uk, the Japanese e-Gov law API, the Chinese State Council policy library, the Australian Federal Register of Legislation, the US eCFR and the Brazilian Camara API (eight harvester runs). Title-searched harvests were filtered with an inclusion/exclusion keyword list before fetching; full-text harvests were not. The collector agents were Claude subagents running in one Claude Code session; the harvesters' instrument type, binding nature and status fields are constants per source.
- Candidates were de-duplicated on normalised URL and on normalised title plus jurisdiction, within the round and against the first collection's registry; the assembly step applies a second title-based pass across the merged collection (84 round-2 rows removed). Byte-identical texts of instrument class count once, and titles that differ only in year, act number, version or amendment wording within one jurisdiction form an instrument family, offered as a further counting unit.
- Counting unit: headline counts use principal instruments; T53b gives the merged collection under each unit and under the two text-based AI-content tiers (autonomy or AI provisions; AI named explicitly). Comparisons with the first collection (T53 to T55) stay on the comparable unit, every text of instrument class, and are consequences of collection design rather than findings about the world; the same holds for the number of jurisdictions with an embodied instrument and for the share of instruments that are binding.
- Capture tier: statistics about what instruments specify in depth use content-analysed captures with at least 150 words; catalogue and landing pages are a separate unit and never enter depth statistics. For ISO and other standards only the public scope or abstract page is available (198 of the 258 round-2 standards are catalogue or landing pages), so those documents are annotated on a short text, flagged as such in the registry, and reported as a separate measurement.
- Texts were fetched from the primary URL with a secondary fallback (CELLAR for EUR-Lex, the UN document API for UNODA and undocs links, the ISO committee mirror for ISO catalogue pages, XML for legislation.gov.uk), and every failed fetch was retried once more after the review of the previous version (four texts recovered). The collectors' shared web-search budget was exhausted part-way through several briefs; later verification relied on direct fetches of official sites. Jurisdictions whose law is not exposed through a reachable database (for example Légifrance, the Singapore statutes site, the Korean, Taiwanese and Hong Kong law portals, the National People's Congress database and several ministry sites) are under-represented, and 189 verified candidates recorded as legally binding remain unread.
- Annotation used the metadata-blind extended-excerpt policy (collector metadata stripped, first 110,000 characters in three slices), so round-2 and first-collection governance documents are directly comparable. The character-aware cleaner (policy tag cjk_clean=v4) replaced the rule that deleted Chinese, Japanese and Korean text, and 503 documents were re-annotated. Four

status and class rules and 157 documented document-level corrections from the governance expert's audit are applied after annotation; the statement in the previous version that no manual overrides touched round-2 rows no longer holds (156 of the 157 correction rows concern round-2 documents). Statutes harvested as consolidated texts carry the year the annotation found, which may be the enactment or the consolidation year; time analyses are restricted to 2014 to 2026 with 2026 partial.

- Validity: every label is model-produced. The collector-agreement tables are a consistency check between AI-agent labels, harvester constants and the annotation; the round-2 reliability sample (n = 160; median kappa 0.86 against a second model, 0.91 for a re-run) measures stability between models, not correctness. No person read or labelled any document, and no human validation exists. The precision audit shows that about 54% of the previous version's binding embodied instruments were distinct, binding and substantive, so every instrument count here is an upper bound on precision; the unread candidates make every count a lower bound on coverage within this collection.
- Not addressed: human validation of labels (no human coders available in this setting); full-text annotation of statutes longer than the 110,000-character excerpt, whose robot provisions may lie beyond it; stricter merging of near-duplicate title pairs beyond the instrument-family grouping.
